

Data Science Toolbox Portfolio (Formative)

01-02 Classification

Daniel Lawson — University of Bristol

Formative Portfolio

This is the **formative** component of the portfolio designed for giving immediate feedback on writing style and expectations. It considers content from [Block 1](#) and [Block 2](#).

Part of Data Science Toolbox.

Deadline: Wednesday Noon, Week 4 (October)

Portfolio Question 1.1.P

- No question (discuss coursework)

Portfolio Question 1.2.P:

- When is an accurate classifier not useful? Can we ensure it is useful?
 - What metrics are better than accuracy? In what sense are they reliable, and do they relate to uncertainty?
 - Hints: take a look at Proper Scoring Rules

Portfolio Question 1.3.P:

- “The purpose of Exploratory Data Analysis is to decide on the right question”
 - What is the question in these data?
 - Have we done enough to understand how to classify attacks?

Portfolio Question 2.1.P:

- When is a bigger model better?
 - If we give more data and parameters to a (regression) model, in what sense does it get better?
 - How is “model goodness” measured accounting for model complexity?
 - Hints: take a look at the motivation for Akaike Information Criterion

Portfolio Question 2.2.P:

- Consider cross validation where we leave out only one datapoint. Is this a good idea? Is it computable for large data?
 - Relate the maths to linear regression.
 - How does leave-one-out relate to other forms of cross validation?

Portfolio Question 2.3.P:

- What would a cross-validation setup that could be used to obtain predictions along with uncertainty quantification for temperature prediction for 2040 based on the Temperature Data used in Workshop 2.3 look like?
 - What are the advantages over LOOCV, and its limitations?
 - You may wish to investigate standard forecasting methods.

Generic Guidance on Portfolios

Guidance on Individual Portfolios

The Portfolio is assessed on each block from 3-10. **Blocks** 1 and 2 are marked similarly but are formative (the Formative Portfolio), i.e. do not contribute to your mark. In each block you will do two activities:

1. Multiple choice questions submitted via Noteable (log in via Blackboard). These should be straightforward, either direct from your notes or with very simple experiments you can conduct as extensions of the Workshop.
2. Long-form reflective questions that should require a deeper understanding of the course material and may require you to undertake further reading or experimentation.
 - **Preparation** that you **prepare in advance** for **in-class activity**
 - **Contributions** that you have made to your group
 - **Discussion** that you present in your portfolio

You may take the multiple-choice component at any time and it is recommended that you do this when you work through the Workshop content. The long-form content is submitted at the end of the course, and you are recommended to make a first draft/note form attempt when you first see the content, and reflect back on it in a finessing stage during the examination preparation time (in lieu of an exam).

Length and format of long-form portfolio

Your (full) Portfolio should give a **one-page** answer to your assigned question in a block. You are only required to submit work for 5 blocks. Therefore the whole Portfolio is only 5 pages long. However:

- The goal is not to make you undertake a length-finessing exercise. If the content you provide appears as if it would fit on one page after such an exercise, you can submit it anyway. **There is a strict limit of 8 pages** for the portfolio content, with answers that are clearly too long being penalised.
- You must submit **Supporting Evidence** as an appendix to the portfolio. It will consist of:
 - Your **Preparation** material, as used in class
 - Your **Contributions**, as provided to your group
 - Any additional material you have created. It will not be directly assessed but may be used as evidence to support your claims, i.e. any statements you make with supporting evidence will be more favourably interpreted. This is not limited. Appropriate content is RMarkdown files knitted to pdf, Jupyter Notebooks, etc.

You will submit your portfolio as either a single PDF for all material, or a PDF plus one combined Evidence file.

For the Formative Portfolio the expectation is 1 page and the limit is 1.5 pages.

Preparing for in-class activity

You are responsible for providing advanced content to be discussed in class. You have been provided with slides which you can use after researching the context. It should cover the topic provided and cover:

- Introduction
 - Slides, workshop or other format - around 5-10 minutes to explain the idea.
 - You won't explain it in detail
 - Try to find some references that explain it properly.
- Non-trivial implication

- Find something that is “interesting” about the topic, for example non-trivial implications, fun place it is applied, historical curiosity, etc
- Discussion activity
 - Typically questions for discussion, worksheet-like calculation to work through, or code example to explore

You are **not judged** on the professionalism of the introduction content, indeed you don't have to use them with your group - you can write on paper, use pictures or just talk. The content instead evidences your preparation and reading. Don't spend too long on this unless you intend to use it directly in your portfolio, the point is to get an interesting discussion going.

Evidencing contributions

You are expected to listen to, and respond to others. You will need to evidence these contributions when you evidence your preparation. You should be able to give 3 examples per week of suggestions you make and how it was received. You don't need to make it positive, just productive.

Portfolio content

Your preparation and in class discussion provides an opportunity to reflect about the topic as an expert, and should lead to a clear framing of a response. Your portfolio will be a 1 page explanation, consisting of approximately 1/2 page background (reference your preparation and the discussion received) and 1/2 page discussion. It should be as mathematical as is appropriate for the subject. You can relegate simple or rote content to your evidence.

Long-form Portfolio Markscheme

- The longform portfolio is worth 80% is total, so these percentages add up to 80.
 - 20%: Evidence. Simple markscheme out of 100:
 - * 50 for “preparing and delivering 5 portfolios discussions” (10/discussion)
 - * 30 for “contributing to at least 10 discussions” (3/discussion)
 - * 20 for “ensuring that your group always received a discussion” (requires evidence that your group received discussions in every session)
 - * These are evidenced in your portfolio by quoting contributions to the black-board discussion.
 - * Contributions are pass/fail. You will receive full marks for any genuine attempt.
 - * For preparing a discussion, you need to evidence that you thought about it in advance by producing notes, your own slides, etc. You do not need to use the provided material, but you should work towards the given question.

- 20%: Connection. The connection between evidence and discussion and the longform portfolio content. Uses maths project mark scheme.
- 20%: Fit. The degree to which you address the question. Uses maths project mark scheme.
- 20%: Depth. The degree to which you have explored and brought in advanced content. Uses maths project mark scheme.

Marking Criteria

The mark ranges and descriptions in normal type below are the University of Bristol Generic Marking criteria that apply to any assessment at the University - these can be found at <https://www.bristol.ac.uk/academic-quality>. The descriptions in bold type are additional maths-specific criteria introduced primarily to clarify the descriptors in the case of marking maths examinations.

0-100 scale	Criteria to be satisfied University generic marking criteria in normal type, Maths-specific marking criteria in bold
100 94 89	• Work would be worthy of dissemination under appropriate conditions • Mastery of advanced methods and techniques at a level beyond that explicitly taught • Ability to synthesise and employ in an original way ideas from across the subject • In group work, there is evidence of an outstanding individual contribution • Excellent presentation • Outstanding command of critical analysis and judgement and • Work develops concepts not directly presented in course material or uses known concepts to answer hard, unfamiliar questions that require calculations/methods not similar to any course material • An elegance of mathematical work beyond that expected for the level of the course • Of a quality that could be distributed to fellow students as an example of exceptional work
83 78 72	• Excellent range and depth of attainment of intended learning outcomes • Mastery of a wide range of methods and techniques • Evidence of study and originality clearly beyond the bounds of what has been taught • In group work, there is evidence of an excellent individual contribution • Excellent presentation and • On standard but unfamiliar problems, carrying out calculations with no errors of understanding • Demonstrates a high level of technical competence with very few mistakes of any kind • Great clarity in mathematical arguments
68 65 62	• Attained all the intended learning outcomes • Able to use well a range of methods and techniques to come to conclusions • Evidence of study, comprehension and synthesis beyond the bounds of what has been explicitly taught • Very good presentation of material • Able to employ critical analysis and judgement • Where group work is involved there is evidence of a productive individual contribution and • Able to make a good attempt at standard but unfamiliar problems, with some minor errors • Demonstrates technical competence, perhaps with some shortcomings • Clear mathematical arguments

0-100 scale	Criteria to be satisfied University generic marking criteria in normal type, Maths-specific marking criteria in bold
58 55 52	- Some limitations in attainment of learning objectives, but has managed to grasp most of them - Able to use most of the methods and techniques taught - Evidence of study and comprehension of what has been taught - Adequate presentation of material - Some grasp of issues and concepts underlying the techniques and material taught - Where group work is involved there is evidence of a positive individual contribution and Able to start standard but unfamiliar problems but with significant errors Able to complete competently “bookwork” questions that have been seen in the course material
48 45 42	- Limited attainment of intended learning outcomes - Able to use a proportion of the basic methods and techniques taught - Evidence of study and comprehension of what has been taught, but grasp insecure - Poorly presented - Some grasp of the issues and concepts underlying the techniques and material taught, but weak and incomplete and Able to complete “bookwork” questions that have been seen in course material with few errors Gaps or inconsistencies in the mathematical argument
35	- Attainment of only a minority of the learning outcomes - Able to demonstrate a clear but limited use of some of the basic methods and techniques taught - Weak and incomplete grasp of what has been taught - Deficient understanding of the issues and concepts underlying the techniques and material taught and Able to reproduce work seen in course material, but with some errors
7-29	- Attainment of nearly all the intended learning outcomes deficient - Lack of ability to use at all or the right methods and techniques taught - Inadequately and incoherently presented - Wholly deficient grasp of what has been taught - Lack of understanding of the issues and concepts underlying the techniques and material taught and Unable to reproduce satisfactorily even “bookwork” questions that have been seen in course material
0	No significant assessable material, absent or assessment missing a “must pass” component
